

okay nice, what do we have so far

Here's the current plan for the dashboard changes.

Access Control

Keep the role-assignment controls at the top:

```
Role:
[ Select a role... ] [ ▼ ] [ + Add ]
```

Then keep the configured role list collapsed by default:

```
9 roles configured
[ View all 9 roles ▼ ]
```

When opened, it displays every permitted role, each with its own **Remove** button:

```
[ Hide all roles ▲ ]

@Trial Staff (1493043585195704340) [ Remove ]
@Staff (1369645083200065566) [ Remove ]
@Carry Manager (1498024595708579972) [ Remove ]
...
```

Transcripts

Add a unified search bar at the top of the transcript list:

```
[ 🔍 Search by ticket ID or username... ]
```

It should search by:

- Ticket number, such as 18427 or #18427
- Username, full or partial, such as ExampleUser or @ExampleUser
- Optionally Discord user ID, if that information is stored with each ticket

It filters while typing and includes an in-field × clear button once a query is present.

Ticket	Opened by	Panel	Closed at	Actions
#18427	@ExampleUser	Support	Sep 5, 2026, 8:41 PM	[View]

Blacklist

Add the same type of search field:

[🔍 Search by username or user ID...]

This finds blacklist entries using:

- Full or partial username
- @username
- Exact Discord user ID

The blacklist table would show both a readable username and the stable user ID for the blacklisted user, as well as the staff member who created the entry.

User	Reason	Added by	Added
@ExampleUser ID: 123456789012345678	Repeated spam	@Moderator ID: 987654321098765432	Sep 5, 2026

Consistency rules

- Use the same search-field styling, magnifying-glass icon, live filtering, and clear × control in both **Transcripts** and **Blacklist**.
- Display usernames first and Discord IDs below them in muted text.
- Store IDs as the authoritative value; usernames are the readable display value and may change.
- Show helpful zero-result messages instead of an empty table:

No transcripts found for “ExampleUser”.
Try a ticket ID, username, or Discord user ID.

No blacklisted users found for “ExampleUser”.
Try a username or Discord user ID.

This gives the dashboard compact default views, consistent searching, and reliable staff/moderation records.
